

Fix my mistakes - sequentially.shortened.sequence function: Solution

David Zeleny

```
# Define the function:  
sequentially.shortened.sentence <- function (sentence = 'No need to have R depression today,  
things go perfectly smoothly!')  
{  
  for (i in nchar (sentence):1)  
    print (substr (sentence, start = 1, stop = i))  
}  
  
# Run the function with default values:  
sequentially.shortened.sentence ()  
  
# Run the function with another sentence:  
sequentially.shortened.sentence (sentence = 'Here we go! Go - where?')
```

Additional notes to the solution:

- I could have also enclosed the expression `print` in the curly brackets (see code below), but since the `print` expression is only a single line of code, this is not necessary:

```
sequentially.shortened.sentence <- function (sentence = 'No need to have R depression today,  
things go perfectly smoothly!')  
{  
  for (i in nchar (sentence):1)  
  {  
    print (substr (sentence, start = 1, stop = i))  
  }  
}
```

- As mentioned in the assignment, I wanted you to only fix my mistakes and mistypes, but not to rewrite the code; if you did, you probably got some minus points.
